MultiRenamer

MultiRenamer is a small and easy-to-use application that allows you to quickly rename your files in bulk. It's wrapped in a comprehensive interface that guides you through all its features. User Interface The program provides a complex yet easy-to-learn menu, with a variety of editing features, such as adding a prefix, suffix or a number to the title,

previewing before renaming, and filtering files. The panel is divided in multiple sections with different purposes, such as browsing folders, editing and applying functions, and previewing all the files in the selected folder. Edit and preview names In the “File options” area you have the ability to add a prefix or suffix to the predefined title, and a unique numeric identifier before or after the name. The starting number and total zeros can be indicated too. Furthermore, you can convert the title to uppercase or lowercase, replace it with another word, customize it the way you want, and modify the extension (e.g. dll to

txt). The “Add/delete/insert” tab lets you add a specific text according to the position you select, inserting it at the start or end of the word. Plus, you can remove or replace characters. The preview feature comes in handy, when you want to try different styles and don't edit the file. A new column is inserted next to the file name in the preview pane. You can mark one or more items, or deselect multiple documents. The “Filter” option is useful in case you want to show only specific files while hiding the rest. You just need to write a word and the program displays titles with that character. Once you are ready to

modify the names, you can apply the changes. Conclusion Taking everything in consideration, MultiRenamer is a simple tool that helps rename single or batch files, with a variety of options, such as adding numbers and letters at the start, middle or end of the words. The polymerization is optionally initiated with a polymerization initiator. Examples of such initiators include azo compounds, peroxides such as di-tert-butyl peroxide, and persulfates, which

are typically added to the reaction mixture in a quantity of 0.001 to 10% by weight of the monomer amount used. At least one cationic surfactant selected from the group consisting of quaternary ammonium compounds and quaternary phosphonium compounds is added to the polymerization reaction mixture to improve the suspension stability of the monomer droplets. As mentioned above, the invention is particularly advantageous in polymerizing acrylate monomers. Examples of such monomers include methyl methacrylate, ethyl methacrylate, butyl methacrylate, isobutyl
