AntiSteg can be run from a USB stick, from your hard drive, or on-line using Remote Access (instant set up). AntiSteg processes images and AVI files stored inside of Windows dynamic link libraries, executables, etc. (image resource files).

AntiSteg allows renaming and deleting of files, as well as scanning and cleaning the files for potentially harmful steganographic content. AntiSteg performs regular scans for changes and/or additions to Windows dynamic link libraries, executables, etc., making it possible to quickly detect those that are added or modified after installation (e.g., when the program is updated). AntiSteg scans for potentially harmful steganographic content in a process- and thread-safe manner.

It then deletes a variety of hidden objects such as macros, startup items, etc. AntiSteg has a unique ability to detect several types of steganographic content, even if it's hidden inside other files, and even if its hidden inside of an image.

AntiSteg has the ability to look for a very large number of different steganographic content types. It allows for steganography detection within command line operations, as well as for advanced steganography detection in conjunction with antivirus software. AntiSteg supports stealth steganography detection for both files of all types (images, video, music, etc.), as well as arbitrary content files (audio, text, etc.). AntiSteg can clean any file type at once, as well as all images,

AVI movies, and, video files. AntiSteg can be used to scan and clean data and log files that contain potentially harmful content. AntiSteg can be used to detect and remove potentially harmful content that is hidden within documents and files.

AntiSteg can also be used to detect and remove potentially harmful content that is hidden inside of images and AVI movies. AntiSteg can be used to detect and remove potentially harmful content that is hidden inside of Microsoft Word documents. AntiSteg is able to look for hidden objects which are not yet digitally signed, as well as verify digital signatures. AntiSteg's file handling is via heuristics, making it possible to process files that have been infected by anti-virus software. AntiSteg allows you to run from a USB stick, or from your hard drive. AntiSteg can also be run from your

CMD shell. AntiSteg has a

The key MACRO pre-possesses a key, that when passed through an encryption function, turns it into a series of code bytes that become part of the image/avi file's header. The difference between a normal MACRO and the key MACRO is that the latter uses a key that is embedded in the file, as opposed to a dynamic key, or a key that is generated externally and passed via a remote computer. KeyMACRO is able to spot changes to the header if any tampering occurs, as well as block the file. AntiSteg Usage Simply put, AntiSteg is a command line utility that allows you to pass the name of the image or AVI file and/or a key file, and clean all of the images and AVI's that are already on the system. AntiSteg will check the file for the presence of a KeyMacro and if found will attempt to execute the key macros, on-the-fly (via a remote server) to ensure that the image/avi file is clean, and that it is devoid of any hidden steganographic messages and/or payloads.

AntiSteg is set up so that the user can either, a) Clean the files already present on the computer, or b) Scan the entire computer for previously infected images and AVI's. AntiSteg is set up so that the user may pass in a single or multiple file names at the command line, that contains: an AVI or image file name (for the first scan) or a full path name to a directory that contains: - one or more file names, that are images - or a folder that contains: - one or more file names that are AVI's - or any combination of the two. The user may also specify the encryption keyfile name, that should be embedded inside of the AVI or image file. AntiSteg will output a clean status, and failure messages. AntiSteg is set up so that the user can choose which of the following would be checked (not all at the same time): image files, AVI files, Image files in a directory, and AVI files in a directory `bc57fa61b`

What's New in the AntiSteg?

AntiSteg is a command line tool for Windows that can be easily used to remove stegged files inside of images or AVI movies. It is designed to be a powerful image / AVI cleaning tool. It is currently the most advanced steganography tool available. Because of this, and in conjunction with the extreme versatility of AntiSteg, it can be used as a powerful anti-piracy tool for all sorts of digital products. AntiSteg detects stegged files, and attempts to remove them in a short time frame (to be exact, in less than one second), by merely examining their content. Afterwards, an AVI file / image is presented to the user, to determine whether the removal process was successful. If it was, a fully working copy of the original file / image is returned (for further examination). Moreover, AntiSteg can be used to remove stegged files from even a most advanced image viewer, or movie player. This eliminates the need to re-examine the file, after it has been cleaned, thus saving your time. Since the content of the original file / image is not changed, the quality of the restored image / AVI file / movie is not degraded. AntiSteg is a very powerful tool, and extremely user-friendly. It works even in the presence of powerful steganographic payloads. AntiSteg does not attempt to extract the actual hidden content, but simply antistegs the content, making it impossible to be retrieved at a later point in time. This approach allows it to quickly

clean a computer, even if 100,000s of images or dozens of AVI movies are stored on it. In contrast, trying to desteg just one image which uses a high encryption encoding (256 bit or higher), and a properly selected password is computationally nearly infeasible. The command line switches for AntiSteg are: `antisteg.exe [options] --[no-]verbose --[no-]help --[no-]display-avifile --[no-]overwrite-original --[no-]quiet --[no-]always-overwrite-new --`
